

Business Professional Add-ins

Key facts:

The XL-Addin Exporter allow user to instantly Convert Microsoft® Excel Document into professional looking Power Point presentations, HTML pages with navigation and menus, Word or PDF documents or even flash movies!

XL-Addin Exporter is the fast, affordable way to create professional-quality Power Point presentations or Web pages.

Its easy-to-use interface allows you to create professional presentation or web pages with hundreds of slides/pages in less than a minute with just one mouse click. Exporting Microsoft Excel documents couldn't be any easier!

XL-Addin components

- Workbook Analyzer
- Export as Web Pages
- Export as Flash movies
- Export to Power Point
- Export to Word
- Export as pictures
- Export as PDF
- Worksheets compare
- Navigator
- Content sheet
- Random Generator

Exporting Excel data on the Web or in Power Point presentations

Would you like your customer or employee to be able to access, from a Web page the financial results or your sales results? Do you need to impress the client with a professional presentation showing the Excel data as slides? By using XI-Addin you could transform your Excel workbooks into professional web pages or presentations that could be shared or published.

The XL-Addin Exporter allow user to instantly Convert Microsoft® Excel Document into professional looking Power Point presentations, HTML pages with navigation and menus, Word or PDF documents or even flash movies!

XL-Addin Exporter is the fast, affordable way to create professional-quality Power Point presentations or Web pages.

By using XL-Addin user could export as web pages or Power Point presentations the entire workbook (all worksheets, more exactly used ranges from each worksheet) or only part of the workbook (some selected ranges or charts).

Key benefits

Fast and easy to use

All settings for export are stored in workbook so after user defines the export parameters, the export could be done with a single mouse click in less than a minute. Furthermore: the settings for export could be imported or exported to XML or could be imported from a different workbook.

Three single steps for exporting the ranges as Power Point presentation or web pages:

1. Define the ranges and charts to be exported
2. Select the export format;
3. Export the ranges

Less user interaction: the export is fully automated: user need only to select the ranges to be exported and the export format, the documents are automatically generated and saved in the same folder with the workbook; a date-time stamp is added to the name of files/folders generated in order to easy identify different versions. Web pages are automatically created with menus, frames, navigation buttons etc. Furthermore on some export (i.e. as flash movies) the Flash objects and the web page are automatically created with the flash object embedded in web page content. The flash movie has zoom and navigation buttons automatically created!

Single form for export: all settings are in a single form in order to increase the productivity; once you create the list with ranges to be created, you could export it with only one mouse click in various formats.

A lot of features like automatically detection for used ranges or defined names or automatically detection for export sizes, clone and edit, cells conditions improve the speed and productivity.

Flexibility

There are a lot of export formats available: web pages with images, web pages with flash movies, web pages with tables and images, single pictures or single PDF documents; Microsoft Word or Power Point presentations.

Fully customizable: user could change the picture format from most used picture formats (JPEG, GIF or PNG); or change the body and navigation colour for the exported pages. User can control the size for exported ranges with options like fixed size, maintain aspect ration or resize at fixed sizes.

You could create a new presentation for showing the Excel data or you could export data into existing Power Point presentation. Furthermore user is able to set exactly the position and sizes for each exported range. A special feature of Power Point exporter allow user to visually adjust the position and size using a preview of the slide where the export will be done.

Anything could be customized: you could create custom presentations by selecting the slides to be exported with just a few mouse clicks; the slides/page order could be changed very easy, the picture format or sizes and positions for all slides could be adjusted/changed in a few seconds! You could test the results before export by selecting only a few slides/pages and you could cancel the export anytime!

Quality and accuracy

Before exporting all ranges and charts are first converted into pictures and the pictures are processed using ImageMagick library (an external components that is installed with XL-Addin). This technique assures a very high level of quality better than by manually operation (copy the ranges and paste them into a Power point presentation). Another advantage of this technique: compression level is excellent but the quality of the images remains very good.

On manually created presentations is practically impossible to align all pictures or to exactly resize them. On XL-Addin this task is done automatically without any error. Furthermore, the positions and sizes could be automatically detected.

Navigation and links arte automatically created making your presentation pr web pages to look great and without errors (duplicate or missing slides on Content slide; duplicate or missing links in navigation on web pages etc).
